### **REASON FOR ALLOWANCE**

1. German patent discloses a method for switching-off the starting up current in electrical vehicles including the teaching of manually providing a switching signal to a rail vehicle and comparing automatically the actual departure time and the deviation between the actual time and the predetermined time which are transmitted and stored for comparison with a plurality of deviations and current switch off times and the switch off instruction or difference is transmitted to the travel controller by the program unit at the switch-off time corresponding to the deviation by the action of the memory responding to the present deviation. Kondo et al, Roehl, and White et al disclose various typed of method for producing switching-off signal including signal input device and data comparison. However, none of the references of record suggests a device for a for a rail vehicle comprising a control unit, wherein the control unit is designed such that it calculates an auxiliary switching-off time, taking account of the determined distance, the determined remaining traveling time, the speed measured value, and the predetermined coasting data, which describes the coasting behavior of the rail vehicle when the drive is switched off, from which said auxiliary switching-off time the rail vehicle will reach the intended next stop on time in accordance with the respective timetable without being driven, and forms the difference between the auxiliary switching-off time and the delay value to determine an advanced drive switching-off time, and treats the advanced drive switching-off time as the recommended drive switching-off time in the manner defined in the instant claims 5 and 10 and in combination with other

limitations of the claims. Therefore, claims 3, 6, 8, 11-12, and 13, depending therefrom, are considered to be allowable.
